Our highly acclaimed cloud based anti-malware software

Maximize your protection

WATCHDOG ANTI MALWARE

Overview

Traditional antivirus engines work signature based. A signature-based system may not be able to take any action if it encounters a new malware that has not yet been identified. However, this is not an issue for WATCHDOG Anti-Malware. The artificial intelligence analyzes malicious properties in the file based on language processing principles. Thus, it can detect and block the malicious content, which has not seen before, more effectively than the signature-based protection system.

The artificial intelligence that has been used in a product can detect and block the malicious content, which has not seen before, more effectively than the signature-based protection system.

Our Operation

LAYER ONE
Standard Scan Module (deep and Custom Scan)

Effectively detects and removes malicious software that has previously been downloaded to the device but has not been activated.

LAYER TWO
Smart Real-Time Protection Module

This module creates the most powerful layer offered by WATCHDOG AntiMalware. Thanks to this module, it effectively detects and blocks malicious software that can escape from the standard scans of the end-user during the execution phase in as short as milliseconds.

LAYER THREE
Smart Scanning Module

This module forms the final layer of WATCHDOG AntiMalware and allows the end user to quickly and effectively clean infected devices.

HOW **it works**

SCAN
First you simply start a scan.

ANALYZE
When our software finds a suspicious files, it passes the fingerprint to our Cloud Scanning Platform where many different anti-virus engine perform checks.

CONFIRM
Watchdog Anti-Malware rapidly sets about removing any confirmed malicious software.
